

QA Findings and Open Issues

1. Purpose

This document records significant observations identified during the current testing stage. Only reproduced or evidenced observations are included.

2. Findings

ID	Area	Observation	Evidence	Current Classification
QF-001	Schema Generation	External validation reported problems in generated XSD	Error screenshot and XSD file	Open finding
QF-002	Generate OD	No significant visible UI change or clear success feedback was observed after selecting Generate OD	Workflow observation and screenshot	Usability observation
QF-003	Scenario Persistence	Updated values remained available after switching between modelling modes	UI observation and generated XML	Verified positive behaviour
QF-004	Scenario XML	Updated variable values were correctly reflected in generated XML	XML comparison	Verified positive behaviour
QF-005	Structural Pruning	Changed flight phase selection was correctly reflected in the generated operational context name	UI and XML comparison	Verified positive behaviour

3. Interpretation

The current testing has identified both successful workflow behaviour and areas requiring further investigation.

The strongest verified positive results are:

- scenario pruning is reflected in generated output
- updated variable values persist
- generated XML reflects tested scenario values
- behaviours are represented in generated scenario XML.

The main open technical issue is schema validation. The main usability observation is insufficient visible feedback for some operations, particularly Generate OD.
